

[RECOVERY METHOD FOR MOBILE PHONE DATA]

Abstract

A recovery method for mobile phone data is provided. The present invention sets and saves a start password in the first mobile phone, and makes the control module of the first mobile phone start. When the user needs the data of the first mobile phone (e.g. loses the first mobile phone), the user can send a news-letter including the start password and a data type in the second mobile phone to the first mobile phone. After the first mobile phone receives the news-letter, the recovery module of the first mobile phone sends the returned pass news-letter including the data of the data type. Thus, the present invention can use the way of the news-letter, and obtain the data saved in the user mobile phone.
